

ABSTRACT OF THE INVENTION

A storage device for sterilizing and storing dental appliances, oral hygiene devices or dental brushes is shown. A vase type container has an opening for receiving dental appliances or oral hygiene devices therein. A sterilization bath container is suspended in the opening. Holes around the opening allow oral hygiene devices or dental brushes to be suspended therearound. Dental appliances, oral hygiene devices or dental brushes are dipped in the sterilization bath and placed inside the vase-type container. Oral hygiene devices or dental brushes are dipped in the sterilization bath prior to being suspended in the holes or placed in the vase-type container. A top is placed over the opening for sealing the sterilization bath and covering dental appliances, oral hygiene devices or dental brushes while allowing fresh air access thereto.
